

MM2MS2 - Mechanics of Solids 2
Exercise Sheet 1 - Combined Loading Solutions

1. In an experiment involving the behaviour of a thin wire of 0.25mm diameter, a mass of 5 kg is suspended from the wire and a torque of 1.72 mNm is applied. Calculate the in-plane principal stresses and the maximum shear stress for this case.
[Ans: $\sigma_1 = 1250.5$ MPa, $\sigma_2 = -251.3$ MPa, $\tau_{\max} = 751$ MPa]

The applied loads cause two stresses to be acting on a plane stress element on the surface of the wire. An axial stress, which can be calculated with $\sigma_y = \frac{F}{A}$ and a torsional shear stress from the applied torque which can be determined by $\tau_{yx} = \frac{TR}{J}$ where $J = \frac{\pi D^4}{32}$.

The mass leads to an axial force of $F = mg = 5 \times 9.81 = 49.05$ N, which in turn leads to an axial stress of $\sigma_y = \frac{F}{A} = \frac{F}{\pi r^2} = \frac{49.05}{\pi \times (0.125 \times 10^{-3})^2} = 999.2$ MPa

$$\tau_{yx} = \frac{TR}{J} = \frac{32 \times 1.72 \times 10^{-3} \times 0.125 \times 10^{-3}}{\pi \times (0.25 \times 10^{-3})^4} = 560 \text{ MPa}$$

Therefore, the plane stress element on the surface of the wire looks like:

The Mohr's circle for this problem therefore looks like:

MM2MS2 - Mechanics of Solids 2
Exercise Sheet 1 - Combined Loading Solutions

So one principal stress will be positive, the other negative.

Recalling the equations for Mohr's circle, the centre is given by, $C = \frac{\sigma_x + \sigma_y}{2}$

while the radius is $R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{yx}^2}$.

The in-plane principal stresses can then be determined as $\sigma_1 = C + R$ and $\sigma_2 = C - R$ while the maximum in-plane shear stress $\tau_{max} = R$.

For this case, $C = \frac{999.2}{2} = 499.6$ MPa, $R = \sqrt{\left(\frac{-999.2}{2}\right)^2 + 560.6^2} = 751$ MPa

Giving:

$$\sigma_1 = C + R = \underline{\underline{1250.5 \text{ MPa}}},$$

$$\sigma_2 = C - R = \underline{\underline{-251.3 \text{ MPa}}},$$

$$\tau_{max} = R = \underline{\underline{751 \text{ MPa}}}$$

2. A thin-walled cylindrical tank is subjected to an internal pressure of 300 kPa and a torsional moment of 15kNm. The outer radius of the tank is 250 mm and the wall thickness is 1 mm. Calculate
 - i) the in-plane principal stresses and the maximum in-plane shear stress
 - ii) the overall maximum shear stress for the stress system
 [Ans: i) $\sigma_1 = 98.95$ MPa, $\sigma_2 = 13.55$ MPa, $\tau_{max} = 42.7$ MPa;
ii) $\tau_{max} = 49.48$ MPa]

For a thin-walled cylinder, the internal pressure leads to a hoop and axial stress which can be determined using $\sigma_\theta = \frac{pR}{t}$ and $\sigma_z = \frac{pR}{2t}$ respectively, we can make the assumption that $\sigma_r = 0$. The torque results in a torsional shear stress, $\tau_{z\theta} = \frac{TR}{J}$, where $J = \frac{\pi}{32}(D_o^4 - D_i^4)$

MM2MS2 - Mechanics of Solids 2
Exercise Sheet 1 - Combined Loading Solutions

Calculating these values, $\sigma_\theta = \frac{300 \times 10^3 \times 0.25}{1 \times 10^{-3}} = 75 \times 10^6 \text{ Pa} = 75 \text{ MPa}$,

$\sigma_z = \frac{300 \times 10^3 \times 0.25}{2 \times 1 \times 10^{-3}} = 37.5 \times 10^6 \text{ Pa} = 37.5 \text{ MPa}$, $\tau_{yx} = \frac{TR}{J} = \frac{32 \times 15 \times 10^3 \times 0.25}{\pi \times (0.5^4 - 0.498^4)} = 38.4 \times 10^6 \text{ Pa} = 38.4 \text{ MPa}$

The plane stress element on the surface of the cylinder looks like:

Which gives a Mohr's circle for this plane of:

Allowing us to calculate the values of the in-plane principal stresses and maximum shear stress.

For this case, $C = \frac{75 + 37.5}{2} = 56.25 \text{ MPa}$,

$R = \sqrt{\left(\frac{75 - 37.5}{2}\right)^2 + 38.4^2} = \sqrt{18.75^2 + 38.4^2} = 42.7 \text{ MPa}$

Giving the results for the in-plane values as:

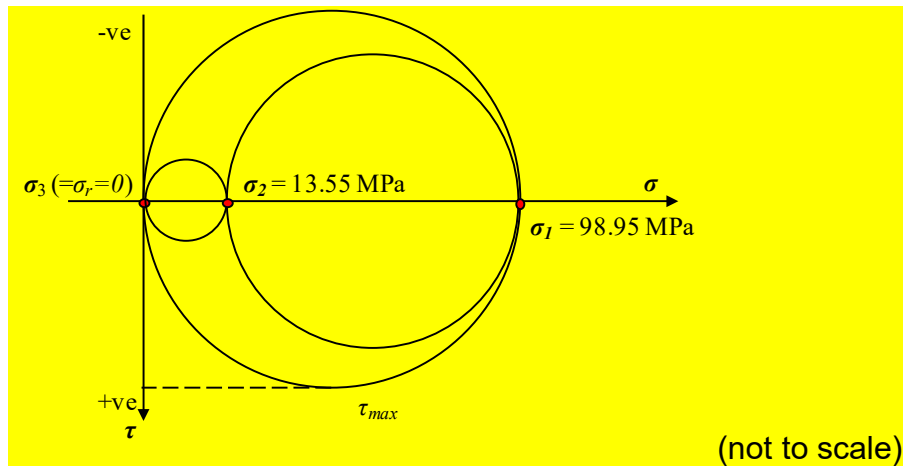

$\sigma_1 = C + R = \underline{\underline{98.95 \text{ MPa}}}$,

MM2MS2 - Mechanics of Solids 2
Exercise Sheet 1 - Combined Loading Solutions

$$\sigma_2 = C - R = \underline{13.55 \text{ MPa}},$$

$$\tau_{max} = R = \underline{42.7 \text{ MPa}}$$

To determine the overall maximum shear stress for the stress system, it is important to consider the third principal stress, σ_3 , which in this case is $\sigma_r = 0$. We can then draw the Mohr's circle including all of the three planes as below:

And the maximum shear stress can be calculated by:

$$\tau_{max} = \frac{\sigma_1 - \sigma_3}{2} = \frac{98.95 - 0}{2} = \underline{49.48 \text{ MPa}}$$

3. A helicopter rotor shaft, 50mm in diameter, transmits a torque of 2.4 kNm and an upward tensile lifting force of 125 kN. Determine the maximum tensile stress, maximum compressive stress and maximum shear stress in the shaft.
[Ans: $\sigma_1 = 134.6 \text{ MPa}$, $\sigma_2 = -71 \text{ MPa}$, $\tau_{max} = 102.8 \text{ MPa}$]

The applied loads cause two stresses to be acting on a plane stress element on the surface of the wire. An axial stress, which can be calculated with $\sigma_y = \frac{F}{A}$ and a torsional shear stress from the applied torque which can be determined by $\tau_{yx} = \frac{TR}{J}$ where $J = \frac{\pi D^4}{32}$.

The axial force of 125 kN leads to an axial stress of $\sigma_y = \frac{F}{A} = \frac{F}{\pi r^2} = \frac{125000}{\pi \times (50 \times 10^{-3})^2} = 63.66 \text{ MPa}$

$$\tau_{yx} = \frac{TR}{J} = \frac{32 \times 2400 \times 25 \times 10^{-3}}{\pi \times (50 \times 10^{-3})^4} = 97.8 \text{ MPa}$$

MM2MS2 - Mechanics of Solids 2
Exercise Sheet 1 - Combined Loading Solutions

This gives us the following stress-state on a plane stress element on the shaft surface:

For this case, $C = \frac{0+63.66}{2} = 31.8 \text{ MPa}$,

$$R = \sqrt{\left(\frac{0-63.66}{2}\right)^2 + 97.8^2} = \sqrt{-31.8^2 + 97.8^2} = 102.8 \text{ MPa}$$

Giving the results for the in-plane values as:

$$\sigma_1 = C + R = \underline{\underline{134.6 \text{ MPa}}}$$

$$\sigma_2 = C - R = \underline{\underline{-71 \text{ MPa}}}$$

$$\tau_{max} = R = \underline{\underline{102.8 \text{ MPa}}}$$

4. A generator shaft of hollow circular cross-section is subjected to a torque of 25 kNm and a compressive load of 900 kN. The outer and inner diameters of the shaft are 200 mm and 160 mm respectively. Determine the in-plane principal stresses and maximum shear stress.

[Ans: $\sigma_1 = 8.3 \text{ MPa}$, $\sigma_2 = -87.9 \text{ MPa}$, $\tau_{max} = 48.1 \text{ MPa}$]

The applied loads cause two stresses to be acting on a plane stress element on the surface of the wire. An axial stress, which can be calculated with $\sigma_y = \frac{F}{A}$ and a torsional shear stress from the applied torque which can be determined by $\tau_{yx} = \frac{TR}{J}$ where $J = \frac{\pi}{32}(D_o^4 - D_i^4)$

$$\text{The axial force of } -900 \text{ kN leads to an axial stress of } \sigma_y = \frac{F}{A} = \frac{F}{\pi(r_o^2 - r_i^2)} = \frac{-900000}{\pi \times (0.1^2 - 0.08^2)} = -79.6 \text{ MPa}$$

$$\tau_{yx} = \frac{TR}{J} = \frac{32 \times 25000 \times 0.1}{\pi \times (0.2^4 - 0.16^4)} = 27 \text{ MPa}$$

MM2MS2 - Mechanics of Solids 2
Exercise Sheet 1 - Combined Loading Solutions

This gives us the following stress-state on a plane stress element on the shaft surface:

For this case, $C = \frac{-79.6}{2} = -39.8 \text{ MPa}$,

$$R = \sqrt{\left(\frac{-79.6}{2}\right)^2 + 27^2} = \sqrt{-39.8^2 + 27^2} = 48.1 \text{ MPa}$$

Giving the results for the in-plane values as:

$$\sigma_1 = C + R = \underline{\underline{8.3 \text{ MPa}}},$$

$$\sigma_2 = C - R = \underline{\underline{-87.9 \text{ MPa}}},$$

$$\tau_{max} = R = \underline{\underline{48.1 \text{ MPa}}}$$

5. For the purpose of analysis, a segment of a crankshaft in a vehicle is presented as shown in Figure Q5. The load $P = 1 \text{ kN}$, and the dimensions are $b_1 = 80 \text{ mm}$, $b_2 = 120 \text{ mm}$ and $b_3 = 40 \text{ mm}$. The diameter of the shaft is $d = 20 \text{ mm}$. Determine the maximum tensile, compressive and shear stresses at point A, located on the surface of the shaft at the z-axis.

[Ans: $\sigma_1 = 31.6 \text{ MPa}$, $\sigma_2 = -184.6 \text{ MPa}$, $\tau_{max} = 108.1 \text{ MPa}$]

MM2MS2 - Mechanics of Solids 2
Exercise Sheet 1 - Combined Loading Solutions

Figure Q5

The load P causes bending and torsion at point A.

The bending moment M can be calculated by:

$$M = P(b_1 + b_3) = 1 \times (0.12) = 0.12 \text{ kNm} = 120 \text{ Nm}$$

The torque can be calculated by:

$$T = Pb_2 = 1 \times 0.12 = 0.12 \text{ kNm} = 120 \text{ Nm}$$

The bending moment causes a compressive stress at A which can be calculated using $\sigma = \frac{My}{I}$ where $y = \frac{d}{2}$ and I is given by $I = \frac{\pi D^4}{64}$ so:

$$\sigma = \frac{64My}{\pi D^4} = \frac{64 \times 120 \times 0.01}{\pi \times 0.02^4} = 153 \times 10^6 \text{ Pa} = 153 \text{ MPa}$$

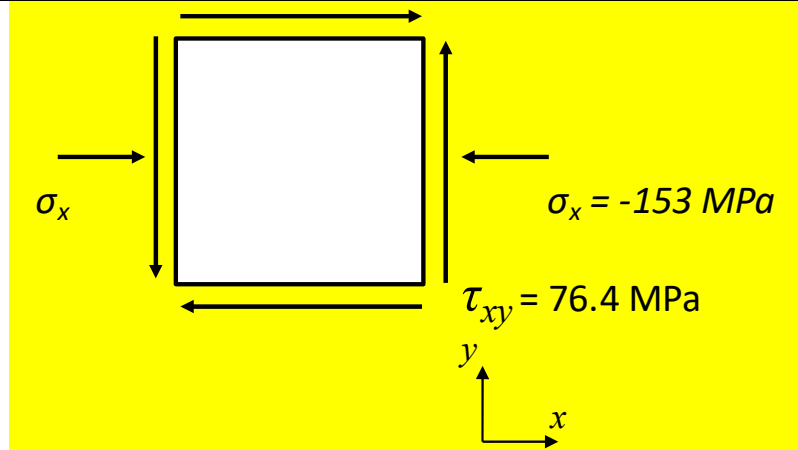

The torque causes a shear stress at A which can be calculated using $\tau = \frac{Tr}{J}$

where $r = \frac{d}{2}$ and J is given by $J = \frac{\pi D^4}{32}$ so:

$$\tau_{yx} = \frac{TR}{J} = \frac{32 \times 120 \times 0.01}{\pi \times 0.02^4} = 76.4 \times 10^6 \text{ Pa} = 76.4 \text{ MPa}$$

Giving a stress state of:

MM2MS2 - Mechanics of Solids 2
Exercise Sheet 1 - Combined Loading Solutions

Which leads to a Mohr's circle:

For this case, $C = \frac{-153}{2} = -76.5 \text{ MPa}$,

$$R = \sqrt{\left(\frac{-153}{2}\right)^2 + 76.4^2} = \sqrt{-76.5^2 + 76.4^2} = 108.1 \text{ MPa}$$

Giving the results for the in-plane values as:

$$\sigma_1 = C + R = \underline{\underline{31.6 \text{ MPa}}}$$

$$\sigma_2 = C - R = \underline{\underline{-184.6 \text{ MPa}}}$$

$$\tau_{max} = R = \underline{\underline{108.1 \text{ MPa}}}$$
